We shall begin with some definitions.

We shall begin with some definitions.

### Definition

Let  $X$  be a set and let  $f : X \rightarrow (-\infty, \infty]$  be a function. Then

$$\text{Dom}(f) := \{x \in X : f(x) < \infty\}.$$

We shall begin with some definitions.

### Definition

Let  $X$  be a set and let  $f : X \rightarrow (-\infty, \infty]$  be a function. Then  
$$\text{Dom}(f) := \{x \in X : f(x) < \infty\}.$$

### Definition

Let  $X$  be a set and let  $f : X \rightarrow (-\infty, \infty]$  be a function. We shall say that  $f$  is a **proper** function if  $\text{Dom}(f) \neq \emptyset$ .

We shall now consider some notation from optimisation theory.

We shall now consider some notation from optimisation theory.

### Definition

Let  $X$  be a set and let  $f : X \rightarrow [-\infty, \infty)$  be a function. Then  
 $\operatorname{argmax}(f) := \{x \in X : f(y) \leq f(x) \text{ for all } y \in X\}$ .

We shall now consider some notation from optimisation theory.

### Definition

Let  $X$  be a set and let  $f : X \rightarrow [-\infty, \infty)$  be a function. Then  $\operatorname{argmax}(f) := \{x \in X : f(y) \leq f(x) \text{ for all } y \in X\}$ .

### Definition

We shall say that a function  $f : X \rightarrow [-\infty, \infty)$  defined on a normed linear space  $(X, \|\cdot\|)$  attains a (or has a) **strong maximum at  $x_0 \in X$**  if,  $f(x_0) = \sup\{f(x) : x \in X\}$  and  $\lim_{n \rightarrow \infty} x_n = x_0$  whenever  $(x_n : n \in \mathbb{N})$  is a sequence in  $X$  such that  $\lim_{n \rightarrow \infty} f(x_n) = \sup\{f(x) : x \in X\} = f(x_0)$ .

## Definition

Let  $(X, \|\cdot\|)$  be a normed linear space and  $f : X \rightarrow (-\infty, \infty]$  be a proper function. Then the **Fenchel conjugate of  $f$**  is the function  $f^* : X^* \rightarrow (-\infty, \infty]$  defined by, (here, and elsewhere,  $X^*$  denotes the dual space of  $X$ )

$$f^*(x^*) := \sup\{x^*(x) - f(x) : x \in X\}.$$

## Definition

Let  $(X, \|\cdot\|)$  be a normed linear space and  $f : X \rightarrow (-\infty, \infty]$  be a proper function. Then the **Fenchel conjugate of  $f$**  is the function  $f^* : X^* \rightarrow (-\infty, \infty]$  defined by, (here, and elsewhere,  $X^*$  denotes the dual space of  $X$ )

$$f^*(x^*) := \sup\{x^*(x) - f(x) : x \in X\}.$$

The final notion that we need before we can precisely state our theorem is that of a  $G_\delta$  set

## Definition

Let  $(X, \|\cdot\|)$  be a normed linear space and  $f : X \rightarrow (-\infty, \infty]$  be a proper function. Then the **Fenchel conjugate of  $f$**  is the function  $f^* : X^* \rightarrow (-\infty, \infty]$  defined by, (here, and elsewhere,  $X^*$  denotes the dual space of  $X$ )

$$f^*(x^*) := \sup\{x^*(x) - f(x) : x \in X\}.$$

The final notion that we need before we can precisely state our theorem is that of a  $G_\delta$  set

## Definition

A subset  $Y$  of a topological space  $(X, \tau)$  is called a  **$G_\delta$  set** if there exists a countable family  $\{O_n : n \in \mathbb{N}\}$  of open subsets of  $X$  such that  $Y = \bigcap_{n \in \mathbb{N}} O_n$ .

We can now precisely state our Variational Theorem.

### Theorem (Abstract Variational Theorem)

*Let  $f : X \rightarrow (\infty, \infty]$  be a proper function on a Banach space  $(X, \|\cdot\|)$ . If there exists a nonempty open subset  $A$  of  $\text{Dom}(f^*)$  such that  $\text{argmax}(x^* - f) \neq \emptyset$  for each  $x^* \in A$ , then there exists a dense and  $G_\delta$  subset  $R'$  of  $A$  such that*

$$(x^* - f) : X \rightarrow [-\infty, \infty)$$

*has a strong maximum for each  $x^* \in R'$ . In addition, if  $0 \in A$  and  $\varepsilon > 0$  then there exists an  $x_0^* \in X^*$  with  $\|x_0^*\| < \varepsilon$  such that  $(x_0^* - f) : X \rightarrow [-\infty, \infty)$  has a strong maximum.*

The first one is a generalisation of James' weak compactness theorem - we need a convex analyst's version of this theorem.

The second one is a result from topology concerning norm continuity of minimal usco mappings.

There are three main tools required to prove this general theorem.

The first one is a generalisation of James' weak compactness theorem - we need a convex analyst's version of this theorem.

The second one is a result from topology concerning norm continuity of minimal usco mappings.

The third one is the “Brøndsted-Rockafellar Theorem”.

## Definition

Suppose that  $f : X \rightarrow (-\infty, \infty]$  is a convex function defined on a normed linear space  $(X, \|\cdot\|)$  and  $x \in \text{Dom}(f)$ . Then we define the **subdifferential**  $\partial f(x)$  by,

$$\partial f(x) := \{x^* \in X^* : x^*(y - x) \leq f(y) - f(x) \text{ for all } y \in \text{Dom}(f)\}.$$

## Definition

Suppose that  $f : X \rightarrow (-\infty, \infty]$  is a convex function defined on a normed linear space  $(X, \|\cdot\|)$  and  $x \in \text{Dom}(f)$ . Then we define the **subdifferential**  $\partial f(x)$  by,

$$\partial f(x) := \{x^* \in X^* : x^*(y - x) \leq f(y) - f(x) \text{ for all } y \in \text{Dom}(f)\}.$$

We now state a convex analysts' version of James' theorem.

## Definition

Suppose that  $f : X \rightarrow (-\infty, \infty]$  is a convex function defined on a normed linear space  $(X, \|\cdot\|)$  and  $x \in \text{Dom}(f)$ . Then we define the **subdifferential**  $\partial f(x)$  by,

$$\partial f(x) := \{x^* \in X^* : x^*(y - x) \leq f(y) - f(x) \text{ for all } y \in \text{Dom}(f)\}.$$

We now state a convex analysts' version of James' theorem.

## Theorem (GJT - Generalised James' Theorem)

*Let  $(X, \|\cdot\|)$  be a Banach space and let  $A$  be a nonempty, open, convex subset of  $X^*$ . If  $\varphi : A \rightarrow \mathbb{R}$  is a continuous, convex function and  $\partial\varphi(x^*) \cap \widehat{X} \neq \emptyset$  for all  $x^* \in A$ , then  $\partial\varphi(x^*) \subseteq \widehat{X}$  for all  $x^* \in A$ .*

Here, and elsewhere,  $\widehat{X}$  denotes the natural embedding of  $X$  into  $X^{**}$ .

To see that Theorem GJT is indeed a generalisation of James' Theorem consider the following:

To see that Theorem GJT is indeed a generalisation of James' Theorem consider the following:

Suppose that  $C$  is a nonempty closed and bounded convex subset of a Banach space  $(X, \|\cdot\|)$  with  $0 \in C$ .

To see that Theorem GJT is indeed a generalisation of James' Theorem consider the following:

Suppose that  $C$  is a nonempty closed and bounded convex subset of a Banach space  $(X, \|\cdot\|)$  with  $0 \in C$ .

Define  $p : X^* \rightarrow \mathbb{R}$  by,

$$p(x^*) := \sup_{c \in C} x^*(c) = \sup_{c \in C} \widehat{c}(x^*) \quad \text{for all } x^* \in X^*.$$

To see that Theorem GJT is indeed a generalisation of James' Theorem consider the following:

Suppose that  $C$  is a nonempty closed and bounded convex subset of a Banach space  $(X, \|\cdot\|)$  with  $0 \in C$ .

Define  $p : X^* \rightarrow \mathbb{R}$  by,

$$p(x^*) := \sup_{c \in C} x^*(c) = \sup_{c \in C} \widehat{c}(x^*) \quad \text{for all } x^* \in X^*.$$

Then  $\widehat{C} \subseteq \partial p(0)$ , since  $p(0) = 0$ , and so

$$\partial p(0) = \{F \in X^{**} : F(x^*) \leq p(x^*) \text{ for all } x^* \in X^*\}.$$

To see that Theorem GJT is indeed a generalisation of James' Theorem consider the following:

Suppose that  $C$  is a nonempty closed and bounded convex subset of a Banach space  $(X, \|\cdot\|)$  with  $0 \in C$ .

Define  $p : X^* \rightarrow \mathbb{R}$  by,

$$p(x^*) := \sup_{c \in C} x^*(c) = \sup_{c \in C} \widehat{c}(x^*) \quad \text{for all } x^* \in X^*.$$

Then  $\widehat{C} \subseteq \partial p(0)$ , since  $p(0) = 0$ , and so

$$\partial p(0) = \{F \in X^{**} : F(x^*) \leq p(x^*) \text{ for all } x^* \in X^*\}.$$

If every  $x^* \in X^*$  attains its supremum over  $C$  then

$$\partial p(x^*) \cap \widehat{X} \neq \emptyset \quad \text{for every } x^* \in X^*.$$

This last fact follows because, if  $x^* \in X^* \setminus \{0\}$ ,  $c \in C$  and  $p(x^*) = x^*(c)$ , then  $\widehat{c} \in \partial p(x^*)$ , since for any  $y^* \in X^*$

This last fact follows because, if  $x^* \in X^* \setminus \{0\}$ ,  $c \in C$  and  $p(x^*) = x^*(c)$ , then  $\widehat{c} \in \partial p(x^*)$ , since for any  $y^* \in X^*$

$$\begin{aligned}\widehat{c}(y^*) - \widehat{c}(x^*) &= y^*(c) - x^*(c) \\ &= y^*(c) - p(x^*) \\ &\leq p(y^*) - p(x^*), \text{ by the definition of } p(y^*).\end{aligned}$$

This last fact follows because, if  $x^* \in X^* \setminus \{0\}$ ,  $c \in C$  and  $p(x^*) = x^*(c)$ , then  $\widehat{c} \in \partial p(x^*)$ , since for any  $y^* \in X^*$

$$\begin{aligned}\widehat{c}(y^*) - \widehat{c}(x^*) &= y^*(c) - x^*(c) \\ &= y^*(c) - p(x^*) \\ &\leq p(y^*) - p(x^*), \text{ by the definition of } p(y^*).\end{aligned}$$

Thus, by the GJT,

This last fact follows because, if  $x^* \in X^* \setminus \{0\}$ ,  $c \in C$  and  $p(x^*) = x^*(c)$ , then  $\widehat{c} \in \partial p(x^*)$ , since for any  $y^* \in X^*$

$$\begin{aligned}\widehat{c}(y^*) - \widehat{c}(x^*) &= y^*(c) - x^*(c) \\ &= y^*(c) - p(x^*) \\ &\leq p(y^*) - p(x^*), \text{ by the definition of } p(y^*).\end{aligned}$$

Thus, by the GJT,

$$\overline{\widehat{C}}^{w^*} \subseteq \partial p(0) \subseteq \widehat{X} \quad \text{since, } \partial p(0) \text{ is weak}^*\text{-closed.}$$

This last fact follows because, if  $x^* \in X^* \setminus \{0\}$ ,  $c \in C$  and  $p(x^*) = x^*(c)$ , then  $\widehat{c} \in \partial p(x^*)$ , since for any  $y^* \in X^*$

$$\begin{aligned}\widehat{c}(y^*) - \widehat{c}(x^*) &= y^*(c) - x^*(c) \\ &= y^*(c) - p(x^*) \\ &\leq p(y^*) - p(x^*), \text{ by the definition of } p(y^*).\end{aligned}$$

Thus, by the GJT,

$$\overline{\widehat{C}}^{w^*} \subseteq \partial p(0) \subseteq \widehat{X} \quad \text{since, } \partial p(0) \text{ is weak}^*\text{-closed.}$$

Hence,  $C$  is weakly compact since the relative weak and weak\* topologies agree on  $\widehat{X}$ .

## Definition

A set-valued mapping  $\varphi$  from a topological space  $A$  into subsets of a topological space  $(X, \tau)$  is  $\tau$ -upper semicontinuous at a point  $x_0 \in A$  if for each  $\tau$ -open set  $W$  in  $X$ , containing  $\varphi(x_0)$ , there exists an open neighbourhood  $U$  of  $x_0$  such that  $\varphi(U) \subseteq W$ .

## Definition

A set-valued mapping  $\varphi$  from a topological space  $A$  into subsets of a topological space  $(X, \tau)$  is  $\tau$ -upper semicontinuous at a point  $x_0 \in A$  if for each  $\tau$ -open set  $W$  in  $X$ , containing  $\varphi(x_0)$ , there exists an open neighbourhood  $U$  of  $x_0$  such that  $\varphi(U) \subseteq W$ . If  $\varphi$  is  $\tau$ -upper semicontinuous at each point of  $A$  then we say that  $\varphi$  is  $\tau$ -upper semicontinuous on  $A$ .

## Definition

A set-valued mapping  $\varphi$  from a topological space  $A$  into subsets of a topological space  $(X, \tau)$  is  $\tau$ -upper semicontinuous at a point  $x_0 \in A$  if for each  $\tau$ -open set  $W$  in  $X$ , containing  $\varphi(x_0)$ , there exists an open neighbourhood  $U$  of  $x_0$  such that  $\varphi(U) \subseteq W$ . If  $\varphi$  is  $\tau$ -upper semicontinuous at each point of  $A$  then we say that  $\varphi$  is  $\tau$ -upper semicontinuous on  $A$ . In the case when  $\varphi$  also has nonempty compact images then we call  $\varphi$  a  $\tau$ -USCO mapping.

## Definition

A set-valued mapping  $\varphi$  from a topological space  $A$  into subsets of a topological space  $(X, \tau)$  is  $\tau$ -upper semicontinuous at a point  $x_0 \in A$  if for each  $\tau$ -open set  $W$  in  $X$ , containing  $\varphi(x_0)$ , there exists an open neighbourhood  $U$  of  $x_0$  such that  $\varphi(U) \subseteq W$ . If  $\varphi$  is  $\tau$ -upper semicontinuous at each point of  $A$  then we say that  $\varphi$  is  $\tau$ -upper semicontinuous on  $A$ . In the case when  $\varphi$  also has nonempty compact images then we call  $\varphi$  a  $\tau$ -usco mapping. Finally, if  $(X, \tau)$  is a linear topological space then we call a  $\tau$ -usco mapping into convex subsets of  $X$ , a  $\tau$ -cusco mapping.

## Definition

A cusco from a topological space  $A$  into subsets of a linear topological space  $X$  is said to be a **minimal cusco** if its graph does not contain, as a proper subset, the graph of any other cusco on  $A$ .

## Definition

A cusco from a topological space  $A$  into subsets of a linear topological space  $X$  is said to be a **minimal cusco** if its graph does not contain, as a proper subset, the graph of any other cusco on  $A$ .

Our interest in cusco mappings is revealed in the next result.

## Definition

Our interest in cusco mappings is revealed in the next result.

## Theorem

*If  $\varphi : U \rightarrow \mathbb{R}$  is a continuous convex function defined on a nonempty open convex subset  $U$  of a normed linear space  $(X, \|\cdot\|)$ , then the subdifferential mapping,  $x \mapsto \partial\varphi(x)$ , is a minimal weak\*-cusco on  $U$ .*

We shall say that a set-valued mapping  $\Phi : A \rightarrow 2^X$  from a topological space  $(A, \tau)$  into subsets of a normed linear space  $(X, \|\cdot\|)$  is **single-valued and norm upper semicontinuous at a point  $x_0 \in A$**  if: (i)  $\Phi(x_0)$  is a singleton and (ii) for every  $\varepsilon > 0$  there exists an open neighbourhood  $U$  of  $x_0$  such that  $\Phi(U) \subseteq B[\Phi(x_0), \varepsilon]$ .

We shall say that a set-valued mapping  $\Phi : A \rightarrow 2^X$  from a topological space  $(A, \tau)$  into subsets of a normed linear space  $(X, \|\cdot\|)$  is **single-valued and norm upper semicontinuous at a point  $x_0 \in A$**  if: (i)  $\Phi(x_0)$  is a singleton and (ii) for every  $\varepsilon > 0$  there exists an open neighbourhood  $U$  of  $x_0$  such that  $\Phi(U) \subseteq B[\Phi(x_0), \varepsilon]$ .

### Theorem (CT - J. P. R. Christensen's Theorem, 1982)

*Let  $\Phi : A \rightarrow 2^{X^{**}}$  be a minimal weak\* cusco from a complete metric space  $A$  into subsets of the second dual of a Banach space  $(X, \|\cdot\|)$ . If  $\Phi(x) \subseteq \widehat{X}$  for all  $x \in A$ , then  $\Phi$  is single-valued and norm upper semicontinuous at the points of a dense and  $G_\delta$  subset of  $A$ .*

The key notion here is the “ $\varepsilon$ -subgradient”.

### Definition

Suppose that  $f : X \rightarrow (-\infty, \infty]$  is a convex proper lower semicontinuous function on a normed linear space  $(X, \|\cdot\|)$  and  $x \in \text{Dom}(f)$ . Then, for any  $\varepsilon > 0$ , we define the  $\varepsilon$ -subdifferential  $\partial_\varepsilon f(x)$  by,

$$\partial_\varepsilon f(x) := \{x^* \in X^* : x^*(y-x) \leq f(y) - f(x) + \varepsilon \text{ for all } y \in \text{Dom}(f)\}.$$

The key notion here is the “ $\varepsilon$ -subgradient”.

### Definition

Suppose that  $f : X \rightarrow (-\infty, \infty]$  is a convex proper lower semicontinuous function on a normed linear space  $(X, \|\cdot\|)$  and  $x \in \text{Dom}(f)$ . Then, for any  $\varepsilon > 0$ , we define the  $\varepsilon$ -subdifferential  $\partial_\varepsilon f(x)$  by,

$$\partial_\varepsilon f(x) := \{x^* \in X^* : x^*(y-x) \leq f(y) - f(x) + \varepsilon \text{ for all } y \in \text{Dom}(f)\}.$$

### Theorem (BRT - Brøndsted-Rockafellar Theorem)

*Suppose that  $f : X \rightarrow (-\infty, \infty]$  is a convex proper lower semicontinuous function on a Banach space  $(X, \|\cdot\|)$ . Then, given any point  $x_0 \in \text{Dom}(f)$ ,  $\varepsilon > 0$  and any  $x_0^* \in \partial_\varepsilon f(x_0)$ , there exists  $x \in \text{Dom}(f)$  and  $x^* \in X^*$  such that  $x^* \in \partial f(x)$ ,  $\|x - x_0\| \leq \sqrt{\varepsilon}$  and  $\|x^* - x_0^*\| \leq \sqrt{\varepsilon}$ .*

## Proposition

*Suppose that  $f : X \rightarrow (-\infty, \infty]$  is a proper function on a Banach space  $(X, \|\cdot\|)$ . Then,*

- (i)  $f^*$  is a convex and weak\* lower semicontinuous function on  $\text{Dom}(f^*)$ ;*
- (ii)  $f^*$  is continuous on  $\text{int}(\text{Dom}(f^*))$ ;*
- (iii) if  $x^* \in \text{Dom}(f^*)$  and  $x \in \text{argmax}(x^* - f)$  then  $\hat{x} \in \partial f^*(x^*)$ ;*
- (iv) if  $\varepsilon > 0$ ,  $x^* \in \text{Dom}(f^*)$ ,  $x \in X$  and  $f^*(x^*) - \varepsilon < x^*(x) - f(x)$  then  $\hat{x} \in \partial_\varepsilon f^*(x^*)$ ;*
- (v) if  $x_0^* \in \text{int}(\text{Dom}(f^*))$ ,  $x \in \text{argmax}(x_0^* - f)$  and  $x^* \mapsto \partial f^*(x^*)$  is single-valued and norm upper semicontinuous at  $x_0^*$  then  $x_0^* - f$  has a strong maximum at  $x$ .*

For those people familiar with the Fenchel conjugate, they may want to look away for a while.

For those people familiar with the Fenchel conjugate, they may want to look away for a while.

- (i) For each  $x \in \text{Dom}(f)$  define  $g_x : X^* \rightarrow \mathbb{R}$  by,  
 $g_x(x^*) := \widehat{\chi}(x^*) - f(x)$ . Then each function  $g_x$  is weak\* continuous and affine. Now for each  $x^* \in X^*$ ,

$$f^*(x^*) = \sup_{x \in \text{Dom}(f)} g_x(x^*).$$

Thus, as the pointwise supremum of a family of weak\* continuous affine mappings, the Fenchel conjugate of  $f$ , is itself convex and weak\* lower semicontinuous. [Recall the general fact that the pointwise supremum of a family of convex functions is convex and the pointwise supremum of a family of lower semicontinuous mappings is again lower semicontinuous].

(ii) Not done here

(ii) Not done here - requires a Baire category argument.

- (ii) Not done here - requires a Baire category argument.
- (iii) Let  $y^*$  be any element of  $\text{Dom}(f^*)$ . Then,

$$\begin{aligned}\widehat{x}(y^*) - \widehat{x}(x^*) &= y^*(x) - x^*(x) \\ &= [y^*(x) - f(x)] - [x^*(x) - f(x)] \\ &= [y^*(x) - f(x)] - f^*(x^*) \\ &\leq f^*(y^*) - f^*(x^*).\end{aligned}$$

Therefore,  $\widehat{x} \in \partial f^*(x^*)$ .

(iv) Let  $y^*$  be any element of  $\text{Dom}(f^*)$ . Then,

$$\begin{aligned}\widehat{x}(y^*) - \widehat{x}(x^*) &= y^*(x) - x^*(x) \\ &= [y^*(x) - f(x)] - [x^*(x) - f(x)] \\ &\leq [y^*(x) - f(x)] - [f^*(x^*) - \varepsilon] \\ &\leq f^*(y^*) - f^*(x^*) + \varepsilon.\end{aligned}$$

Therefore,  $\widehat{x} \in \partial_\varepsilon f^*(x^*)$ .

(v) Let  $(x_n : n \in \mathbb{N})$  be a sequence in  $X$  such that

$$\lim_{n \rightarrow \infty} (x_0^* - f)(x_n) = \sup_{x' \in X} (x_0^* - f)(x') = f^*(x_0^*).$$

We will show that  $(x_n : n \in \mathbb{N})$  converges to  $x$ . Let  $\varepsilon > 0$ . By (iii) and the assumption that  $\partial f^*(x_0^*)$  is a singleton we have that  $\partial f^*(x_0^*) = \{\hat{x}\}$ . Since,  $x^* \mapsto \partial f^*(x^*)$ , is norm upper semicontinuous at  $x_0^*$  there exists a  $0 < \delta < \varepsilon$  such that if  $\|x^* - x_0^*\| \leq \delta$  then  $\|F - \hat{x}\| < \varepsilon$  for all  $F \in \partial f^*(x^*)$ . Choose  $N \in \mathbb{N}$  such that  $(x_0^* - f)(x_n) > f^*(x_0) - \delta^2$  for all  $n > N$ . Then, by (iv),  $\hat{x}_n \in \partial_{\delta^2} f^*(x_0^*)$  for all  $n > N$ . Let  $n > N$ . Then, by the Brøndsted-Rockafellar Theorem, there exist  $x_n^* \in \text{Dom}(f^*)$  and  $F_n \in X^{**}$  such that  $F_n \in \partial f^*(x_n^*)$ ,  $\|x_n^* - x_0^*\| \leq \delta$  and  $\|F_n - \hat{x}_n\| \leq \delta < \varepsilon$ . Therefore,

$$\|x_n - x\| = \|\hat{x}_n - \hat{x}\| \leq \|\hat{x}_n - F_n\| + \|F_n - \hat{x}\| \leq \varepsilon + \varepsilon = 2\varepsilon.$$

## Theorem (Abstract Variational Theorem)

*Let  $f : X \rightarrow (-\infty, \infty]$  be a proper function on a Banach space  $(X, \|\cdot\|)$ . If there exists a nonempty open subset  $A$  of  $\text{Dom}(f^*)$  such that  $\text{argmax}(x^* - f) \neq \emptyset$  for each  $x^* \in A$ , then there exists a dense and  $G_\delta$  subset  $R'$  of  $A$  such that*

$$(x^* - f) : X \rightarrow [-\infty, \infty)$$

*has a strong maximum for each  $x^* \in R'$ . In addition, if  $0 \in A$  and  $\varepsilon > 0$  then there exists an  $x_0^* \in X^*$  with  $\|x_0^*\| < \varepsilon$  such that  $(x_0^* - f) : X \rightarrow \mathbb{R} \cup \{-\infty\}$  has a strong maximum.*

## Proof.

Consider  $\partial f^* : A \rightarrow 2^{X^{**}}$ . Then, by the Proposition part (iii),  $\partial f^*(x^*) \cap \widehat{X} \neq \emptyset$  for all  $x^* \in A$ . Thus, by GJT,  $\partial f^*(x^*) \subseteq \widehat{X}$  for all  $x^* \in A$ . Therefore, by CT, there exists a dense and  $G_\delta$  subset  $R'$  of  $A$  such that  $\partial f^*$  is single-valued and norm upper semicontinuous at each point of  $R'$ . So, by the Proposition part (v),  $(x^* - f)$  has a strong maximum for each  $x^* \in R'$ .  $\square$

## Proof.

Consider  $\partial f^* : A \rightarrow 2^{X^{**}}$ . Then, by the Proposition part (iii),  $\partial f^*(x^*) \cap \widehat{X} \neq \emptyset$  for all  $x^* \in A$ . Thus, by GJT,  $\partial f^*(x^*) \subseteq \widehat{X}$  for all  $x^* \in A$ . Therefore, by CT, there exists a dense and  $G_\delta$  subset  $R'$  of  $A$  such that  $\partial f^*$  is single-valued and norm upper semicontinuous at each point of  $R'$ . So, by the Proposition part (v),  $(x^* - f)$  has a strong maximum for each  $x^* \in R'$ .  $\square$

## Definition

Let  $C$  be a nonempty closed and bounded convex subset of a normed linear space  $(X, \|\cdot\|)$ . We shall say that a point  $x_0 \in C$  is a **strongly exposed point of  $C$**  if there exists an  $x^* \in X^*$  such that  $x^*|_C$  has a strong maximum at  $x_0$ .

## Definition

Let  $C$  be a nonempty closed and bounded convex subset of a normed linear space  $(X, \|\cdot\|)$ . We shall say that a point  $x_0 \in C$  is a **strongly exposed point of  $C$**  if there exists an  $x^* \in X^*$  such that  $x^*|_C$  has a strong maximum at  $x_0$ .

Note that if  $f : X \rightarrow (-\infty, \infty]$  is defined by,  $f(x) := 0$  if  $x \in C$  and  $f(x) := \infty$  otherwise, then we have the following:

## Definition

Let  $C$  be a nonempty closed and bounded convex subset of a normed linear space  $(X, \|\cdot\|)$ . We shall denote by  **$\text{Exp}(C)$**  the set of all strongly exposed points of  $C$ .

## Theorem

*If  $C$  is a weakly compact convex subset of a Banach space  $(X, \|\cdot\|)$  then  $C = \overline{\text{co}}(\text{Exp}(C))$ .*

## Theorem

*If  $C$  is a weakly compact convex subset of a Banach space  $(X, \|\cdot\|)$  then  $C = \overline{\text{co}}(\text{Exp}(C))$ .*

Proof: Let  $f : X \rightarrow (-\infty, \infty]$  be defined by,  $f(x) := 0$  if  $x \in C$  and by  $f(x) := \infty$  otherwise.

## Theorem

*If  $C$  is a weakly compact convex subset of a Banach space  $(X, \|\cdot\|)$  then  $C = \overline{\text{co}}(\text{Exp}(C))$ .*

**Proof:** Let  $f : X \rightarrow (-\infty, \infty]$  be defined by,  $f(x) := 0$  if  $x \in C$  and by  $f(x) := \infty$  otherwise. Then, since  $C$  is weakly compact,  $\text{argmax}(x^* - f) = \text{argmax}(x^*|_C) \neq \emptyset$ .

## Theorem

*If  $C$  is a weakly compact convex subset of a Banach space  $(X, \|\cdot\|)$  then  $C = \overline{\text{co}}(\text{Exp}(C))$ .*

**Proof:** Let  $f : X \rightarrow (-\infty, \infty]$  be defined by,  $f(x) := 0$  if  $x \in C$  and by  $f(x) := \infty$  otherwise. Then, since  $C$  is weakly compact,  $\text{argmax}(x^* - f) = \text{argmax}(x^*|_C) \neq \emptyset$ . Therefore, by the Abstract Variational Theorem, there exists a dense and  $G_\delta$  subset  $R$  of  $X^*$  such that  $(x^* - f)$  has a strong maximum for each  $x^* \in R$ .

## Theorem

*If  $C$  is a weakly compact convex subset of a Banach space  $(X, \|\cdot\|)$  then  $C = \overline{\text{co}}(\text{Exp}(C))$ .*

**Proof:** Let  $f : X \rightarrow (-\infty, \infty]$  be defined by,  $f(x) := 0$  if  $x \in C$  and by  $f(x) := \infty$  otherwise. Then, since  $C$  is weakly compact,  $\text{argmax}(x^* - f) = \text{argmax}(x^*|_C) \neq \emptyset$ . Therefore, by the Abstract Variational Theorem, there exists a dense and  $G_\delta$  subset  $R$  of  $X^*$  such that  $(x^* - f)$  has a strong maximum for each  $x^* \in R$ . Now suppose, in order to obtain a contradiction, that  $C \neq \overline{\text{co}}(\text{Exp}(C))$ .

## Theorem

If  $C$  is a weakly compact convex subset of a Banach space  $(X, \|\cdot\|)$  then  $C = \overline{\text{co}}(\text{Exp}(C))$ .

**Proof:** Let  $f : X \rightarrow (-\infty, \infty]$  be defined by,  $f(x) := 0$  if  $x \in C$  and by  $f(x) := \infty$  otherwise. Then, since  $C$  is weakly compact,  $\text{argmax}(x^* - f) = \text{argmax}(x^*|_C) \neq \emptyset$ . Therefore, by the Abstract Variational Theorem, there exists a dense and  $G_\delta$  subset  $R$  of  $X^*$  such that  $(x^* - f)$  has a strong maximum for each  $x^* \in R$ . Now suppose, in order to obtain a contradiction, that  $C \neq \overline{\text{co}}(\text{Exp}(C))$ . Then there exists an  $x_0 \in C \setminus \overline{\text{co}}(\text{Exp}(C))$  and an  $x^* \in X^*$  such that

$$\sup\{x^*(c) : c \in \overline{\text{co}}(\text{Exp}(C))\} < x^*(x_0).$$

## Theorem

If  $C$  is a weakly compact convex subset of a Banach space  $(X, \|\cdot\|)$  then  $C = \overline{\text{co}}(\text{Exp}(C))$ .

Proof: Let  $f : X \rightarrow (-\infty, \infty]$  be defined by,  $f(x) := 0$  if  $x \in C$  and by  $f(x) := \infty$  otherwise. Then, since  $C$  is weakly compact,  $\text{argmax}(x^* - f) = \text{argmax}(x^*|_C) \neq \emptyset$ . Therefore, by the Abstract Variational Theorem, there exists a dense and  $G_\delta$  subset  $R$  of  $X^*$  such that  $(x^* - f)$  has a strong maximum for each  $x^* \in R$ . Now suppose, in order to obtain a contradiction, that  $C \neq \overline{\text{co}}(\text{Exp}(C))$ . Then there exists an  $x_0 \in C \setminus \overline{\text{co}}(\text{Exp}(C))$  and an  $x^* \in X^*$  such that

$$\sup\{x^*(c) : c \in \overline{\text{co}}(\text{Exp}(C))\} < x^*(x_0).$$

Since  $C$  is bounded and  $R$  is dense in  $X^*$  we can assume, without loss of generality, that  $x^* \in R$ .

But then  $\operatorname{argmax}(x^*) = \operatorname{argmax}(x^* - f) =: \{x\}$  is a strong maximum of  $(x^* - f)$ , and hence a strongly exposed point of  $C$ .

But then  $\operatorname{argmax}(x^*) = \operatorname{argmax}(x^* - f) =: \{x\}$  is a strong maximum of  $(x^* - f)$ , and hence a strongly exposed point of  $C$ . On the other hand,

$$\sup\{x^*(c) : c \in \overline{\operatorname{co}}(\operatorname{Exp}(C))\} < x^*(x_0) \leq x^*(x);$$

which implies that  $x \notin \operatorname{Exp}(C)$ .

But then  $\operatorname{argmax}(x^*) = \operatorname{argmax}(x^* - f) =: \{x\}$  is a strong maximum of  $(x^* - f)$ , and hence a strongly exposed point of  $C$ . On the other hand,

$$\sup\{x^*(c) : c \in \overline{\operatorname{co}}(\operatorname{Exp}(C))\} < x^*(x_0) \leq x^*(x);$$

which implies that  $x \notin \operatorname{Exp}(C)$ . Thus, it must be the case that  $C = \overline{\operatorname{co}}(\operatorname{Exp}(C))$ .

But then  $\operatorname{argmax}(x^*) = \operatorname{argmax}(x^* - f) =: \{x\}$  is a strong maximum of  $(x^* - f)$ , and hence a strongly exposed point of  $C$ . On the other hand,

$$\sup\{x^*(c) : c \in \overline{\operatorname{co}}(\operatorname{Exp}(C))\} < x^*(x_0) \leq x^*(x);$$

which implies that  $x \notin \operatorname{Exp}(C)$ . Thus, it must be the case that  $C = \overline{\operatorname{co}}(\operatorname{Exp}(C))$ .

Thank you for your attention and for the opportunity to present my work.
